The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and cher cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune cliscase, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular diseases such as mycardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parastici infections.

Conter The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Musculoskeletal system antigen; cancer; metastasis; re-vascularisation; thrombosis; arteriosclerosis; mineral content; cardiovascular condition; wound; injury, burn, angiogenesis; ulcer; post-operative tissue repair; limb regeneration; neuronal growth, neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; AIDS-related complex; chondrocyte growth; bone regeneration; periodontal regeneration; tissue transport; bone graft; skin aging; keratinocyte growth; hair loss; melanocyte growth; call proliferation; cell growth; organ transplant; cell differentiation; body height;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                             Isolated polypeptide for treating, preventing and/ or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g.

This invention describes a novel protein conjugate (I) comprising at least 1 functional region (FR) at any position in the sequence of a carrier protein (II) to form a capaid three-diamesional structure of the Lumazine synthase (LS) type, such that the outer periphery is covalently inked to many FR. The invention also describes (I) a hetero-oligomeric protein conjugate (Ia) comprising either a mixture of at least 1 (I) and at least 1 (II) that lacks FR, with the components optionally covalently linked by chemical treatment; and the components optionally covalently linked by chemical treatment; (I) a method for preparation of (I) that encodes (I); (S) as vector for preparation of (I); (A) a DNA (III) that encodes (I); (S) LS from Bacillus subtilis with Cys 33 and/or Cysi39 replaced by Ser; (6) DNA (IIIa) encoding LS from Aquifex acolius which is codon-optimized for expression in a recombinant Escherichia coli strain; (T) a chimeric cypression in a recombinant Escherichia coli strain; (T) a chimeric protein (CP) comprising amino acids (aa) 1-60 from LS of B. subtilis and aa 61-154 from LS of A. acolius for use as (II); and (B) pharmaceutical compositions and vaccines containing (I) and (Ia). The products of the invention have cytostatic, antiviral and antibacterial activity and can be used in a vaccine or for gene therapy. (I) are used as pharmaceutical cumors) and in vaccines, including multivalent vaccines, against cumors) and in vaccines, including multivalent vaccines, against bacterial or viral infections, to produce diagnostic or therapeutic antibodies, and for preparation of produce diagnostic or therapeutic antibodies, and for preparation of produce diagnostic or therapeutic antibodies, and for preparation of produce diagnostic or therapeutic cused as biosensors and for preparation of protein libraries, (I) may also be used as biosensors and for preparation of protein conforted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Lumazine synthase, capsid; cytostatic, antiviral, antibacterial; vaccine, gene therapy, immunotherapy, biosensor; diagnosis.
                                           Protein conjugate based on lumazine synthase as carrier, useful e.g. for vaccination and immunotherapy, contains many functional molecules attached to outside of the carrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       spherical particle (LS comprises 60 subunits that assemble into an icosahedron). The large number of FR may increase sensitivity in immunoassays and the efficiency of immunotherapy agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       69.6%; Score 32; DB 21; Length 156;

                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a Staphylococcus aureus protein of unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCH 29 in Becherichia coll. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                              Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - used to isolate antimicrobial compounds, and in vaccines against S.

This invention describes a novel protein conjugate (1) comprising at least 1 functional region (FR) at any position in the sequence of a least 1 least 1 functional region (FR) at any position in the sequence of a least 1 carrier protein (II) to form a cappid three-dimensional structure of the carrier protein conjugate (Ia) type, such that the outer periphery is covalently linked to many FR. The invention also describes (1) a hetero-oligomeric protein conjugate (Ia) comprising either a mixture of at least 2 confidence of infeath (I) and at least 1 (II) that lacks FR, with the components optionally covalently linked by chemical treatment; (2) a method for preparation of (I) and (Ia); (3) a vector for preparation of (I); (4) a DNA (III) that encodes (I); (5) LS from Aguifex aeolius which is codon-optimized for preparation (FI); (A) and (III) that encodes (I); (5) LS from Aguifex aeolius which is codon-optimized for expression in a recombinant Escherichia coli strain; (7) a chimeric compositions and vaccines containing (I) and (Ia); (B) by protein (CP) comprising amino acids (aa) 1-60 from LS of B. subtilis and acinvention have cytostatic, and in a land (I) and (Ia); and (B) pharmaceutical convention by average containing (I) and (Ia); and (B) pharmaceutical convention and vaccines containing (I) and (Ia); and (B) pharmaceutical cumventherapy of human immune deficiency virus infection or containing multivalent vaccines, against contibodies, and for preparation of protein libraries. (I) are useful in DNA vaccines and for preparation of protein libraries (I) and subsender of appearation of protein libraries (I) are useful in DNA vaccines and for preparation of protein libraries (I) are useful in DNA vaccines and for preparation of protein largement assemble into a constain many FR (same of aliferent) at the surface of a spherical particle (LS comprises 60 subunits that assemble into a constant many PR (same of a seminary PR (same of a seminary protein large number of FR may increase sensitivity in may also be constan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6,7-dimethyl-8-ribityl-lumazine synthase; flavin biosynthesis pathway;
inhibitor; plant; herbicide; ribE.
                                                                                                                 Protein conjugate based on lumazine synthase as carrier, useful e.g. for vaccination and immunotherapy, contains many functional molecules attached to outside of the carrier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 32; DB 21; Length 156;

This invention describes a novel isolated 6,7-dimethyl-8-ribityl-lumazine synthase protein (I). The invention also describes (i) isolated DNA encoding (I), and optionally at least one other enzyme of the flavin concorns pathway; (2) a screening assay for 6,7-dimethyl-8-ribityl-10 biosynthesis pathway; (2) a screening assay for 6,7-dimethyl-8-ribityl-10 containing (I), 5-amino-6-ribitylamino-2,4(IH,3H)-pyrimidinedione (II) containing (I), 5-amino-6-ribitylamino-2,4(IH,3H)-pyrimidinedione (II) and 3,4-dihydroxy-2-butanone 4-phosphate (III) in the presence and cabsence of a test compound, and comparing the amounts of 6,7-dimethyl-8-ribityl-lumazine formed; (3) a screening assay for inhibition-resistant cribityl-lumazine formed; (3) a screening assay for inhibition-resistant (5,7-dimethyl-8-ribityl-lumazine formed absence of a specific 6,7-dimethyl-8-ribityl-lumazine comparing a mutant 6 (I), (II) and (III) in the comparing the amounts of 6,7-dimethyl-8-ribityl-CC synthase in a plant, by treatment with a compound identified by the assay of (2). (I) is useful for screening for 6,7-dimethyl-8-ribityl-lumazine cof (2). (I) is useful for screening for 6,7-dimethyl-8-ribityl-lumazine comparing the amounts of 6,7-dimethyl-8-ribityl-lumazine cof (2). (I) is useful for screening for 6,7-dimethyl-8-ribityl-lumazine comparing for 6,7-dimethyl-8-ribityl-lumazine cof comparing for 6,7-dimethyl-8-ribityl-lumazine cof comparing for 6,7-dimethyl-8-ribityl-lumazine cof comparing for 6,7-dimethyl-8-ribityl-lumazine cof comparing for 6,7-dimethyl-8-ribityl-lumazine comparing comparing compound identified by the assay comparing comparing compound identified by the assay comparing comparing compound identified by the comparing comparing compound comparing comparing comparing comparing compound comparing comparing comparing comparing comparing compari

                                                                                                                                                                            The invention relates to human polynuclectides (AAI79941-AAI93841) and cytokine, cell proliferation or cell differentiation or which may induce production of cher cytokines. The production of cher cytokines in other cell populations. The polynuclectides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA probes for detecting brown adipose tissue gene - contg. nucleic acid sequence recognising uncoupling protein gene or mRNA
                                                                                        Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

                              The inventors claim probes for detecting the gene or mRNA coding for synthesis of the uncoupling protein of mammalian brown adipose tissue mitochondria. The probes may be used as research tools for screening drugs for the ability to induce brown adipose tissue (BAT) formation. e.g. for treatment of obesity. The probes are produced by isolating the 175 fraction of the BAT polyA RNA from cold-adapted animals and using it to prepare CDNA upon which the probes are based. (Updated on 25-MAR-2003 to correct PA fileld.)
